## Population Movement Monitoring Flash Update

■ 11 October 2025

Since 10 Oct

310,120

## OVERVIEW OF DISPLACEMENT MOVEMENTS

- On 10 October, following the announcement of the ceasefire, population
  movements were recorded across several areas, including movements from West
  to East within Khan Younis and from the southern part of Gaza towards northern
  areas. On 11 October, a total of 128,320 displacement movements were
  recorded.
- Since 10 October, approximately 291,920 displacement movements have been observed crossing from south to north primarily through Al-Rasheed Road, with additional movements noted along Salah Al-Deen Road.
- In addition, since 10 October 18,200 displacement movements were recorded from the western parts of Khan Younis towards the eastern areas of the governorate, reflecting a shift in movement patterns within the southern region.
- Compared to the previous day, a significant increase in vehicle movements was observed, particularly involving cars and trucks.

## METHODOLOGY

- The figures on crossings from south to north were collected through imagery analyis as well as two Flow Monitoring Points (FMPs) located in Deir Al Balah, while movements from west to east were recorded through one FMP in Khan Younis. These figures only reflect the displacement movements observed at these specific points. It is therefore possible that some people may have split from their groups or changed routes before reaching the monitored FMPs, meaning certain movements may not have been captured.
- The FMPs operate daily from 8:00 AM to 5:00 PM. Therefore, movements
  occurring beyond this timeframe are not captured, which represents a limitation
  in monitoring the overall flow of displacement.
- The data presented in this report reflects displacement movements recorded up to 5:00 PM on 11 October 2025 (Gaza time). Movements recorded after this time will be included in the next report.
- The numbers refer to displacement movements, and not individuals. People are displaced multiple times, therefore what is reported is flow figures rather than stock figures. Access constraints continue to pose significant challenges, impacting data quality.
